PHAC Communication Re: Emerging global HAI-AMR issue – *Candida auris*

PHAC has recently learned of a public health alert from US CDC in relation to the global emergence of invasive infections caused by the Multidrug-Resistant yeast organism, *Candida auris*.

While *C. auris* is not common, it can cause invasive infections associated with high mortality and has also been known to cause outbreaks in healthcare facilities.

Information available to date indicates that cases of *C. auris* have occurred in at least nine countries including Japan, Korea, India, Pakistan, Kuwait, South Africa, Venezuela, Colombia, and (most recently) the United Kingdom.

To date, the Public Health Agency of Canada (PHAC) has not received notification of any Canadian cases of *C. auris* infection.

This message is being shared with PHAC’s public health partners across Canada to make you aware of this important emerging AMR issue with potential implications for healthcare facilities. If you do become aware of any confirmed cases, please report these to PHAC at CARSS-SCSRA@phac-aspc.gc.ca.
